The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

ABR92115-ABK92263 represent prostate cancer-associated polynucleotide

Novel PROST 03 polypeptides and polynucleotides useful in research, diagnosis and therapeutic applications, particularly for use in cancer therapeutics

Claim 6; Fig 1; 77pp; English.

the polynuclectide (II) encoding PROST 03. (TII) is useful for selectively destroying a cell expressing (I), and for treating a disease-state associated with expression (I), and for treating a disease-state associated with expression (I), and for treating a disease-state sesful for diagnosing metastasis associated with (I), in a subject.

(I) is also useful for diagnosing and treating diseases of cell proliferation such as prostate cancers. (I) is also useful for generating antibodies to prostate cancers. (I) is also useful for generating antibodies to prost 03. (III) is useful in detecting the levels of PROST 03 on this prostate cancers. (I) is also useful for generating and metastatic tumours. (I) is also useful in diagnostic assays for detecting the levels of polypucleotides encoding prost 03 in cells and tissues. (II) is useful as DNA probes, as targets for antisense polymucleotides encoding prost or antisense polymucleotides. (II) are useful in research, biological, clinical and therapeutic purposes. (I) he present sequence represents the coding sequence of human PROST 03. invention relates to an isolated PROST 03 polypeptide (I) and to The

The encoded immunogen, or the DNA itsecan be used as a vaccine for the treatment of prostate cancer. The I was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

The present sequence was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated T cells and incubated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to

```
The present invention describes isolated polypeptides, comprising an immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polypruclectides encoding them have cytośtatic activity and can be used in vaccines and in gene therapy. The polypeptides and polypeptides and polypeptides and polypeptides, antibodies against the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polynucleotides encoding the polypeptides can be used as a probe or to modulate the expression of the polypeptides. AAA06241 to AAA06691 and AAY82000 to AAX82020 represent sequences used in the exemplification of the present invention.

```
polymucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting calls expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polymucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polymucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polymucleotide of the invention.

The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polynucleotides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes P704P, P774P, P775P and B305D are located in a genomic region on chromosome 22q11.2 known as the Cat Eye Syndrome region. Prostate specific antigen (PSA) P501S was located on chromosome 1. AAH84671 to AAH85143 and AAG99000 to AAG99077 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an immunogenic portion of diagnosis and therapy of

```
The present invention describes an isolated polypeptide (I) comprising I least an immunogenic portion of a prostate tumour antigen protein or so variant. (I) have oylostatic activity and can be used in vaccine coduction. (I), prostate tumour antigen polynucleotides, an antigen resenting cell (APC e.g. a dendritic cell) that expresses (I), and a armaceutical composition containing (I) are useful for inhibiting the evelopment of cancer in a patient. Antibodies specific for prostate evelopment of cancer in a patient. Antibodies specific for prostate secific proteins and oligonucleotides that hybridise to a blynucleotide that encodes a prostate specific protein are useful by detecting the presence or absence of a cancer or monitoring the cogression the progression of a cancer, especially prostate cancer. ANG2422 to AAB74798 to AAB74821 and AAB74830 are sequences sed in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ite tumour antigen determined full length cDNA sequence for L1-12.
                                                                                                                                                                                                polynucleotide, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tumour antigen; prostate tumour; therapy; diagnosis; immunogenic; cytostatic; vaccine; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a cDNA described in the invention.

The sequences are useful for treating cancer, preferably breast cancer, in a patient or for stimulating an immune response. The polynucleotides and polypeptides are also useful in the diagnosis and monitoring of breast cancer. A method for detecting the presence of a

of
cancer in a patient, comprises obtaining a biological sample from the patient, contacting the biological sample with a binding agent that bind to a breast tumour polypeptide, detecting in the sample an amount of polypeptide that binds to the binding agent, and comparing the amount of polypeptide to a predetermined cut-off value, therefore determining the presence of a cancer in the patient.isquences ABK28920-ABK29025 represent cDNA clones encoding human breast tumour polypeptides of the

The present sequence is that of a triple gene fusion comprising, from the 5' end, the trax thioredoxin gene from Escherichia coli, the human ubiquitin coding sequence, the prostate antigen P501S (amino acids 55-55) coding sequence, and pNA encoding a histidine tail. The triple fusion was constructed in plasmid pRITI5063, which included the Saccharomyces cerevisiae CUP1 promoter and yeast alpha prepro signal sequence. The triple fusion protein (see AMM50661) was production of friple fusion proteins of the production of triple fusion proteins of the invention comprising ubiquitin fused between thioredoxin and a notein of interest, in this case P501S(aa55-553). A claimed method of producing a recombinant protein of interest involves: culturing a host cell (preferably E. coll) under conditions which allow for co-expression of the triple fusion and a ubiquitin specific endoprotease (especially UBP1 from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel DNA sequence encoding triple fusion protein comprising ubiguitin fused between thioredoxin and polypeptide of interest, useful for producing recombinant polypeptide of interest suitable for medicinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             663
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pecific endoprotease in vivo. In the present case, protein of 509 amino acids is generated. The

The triple fusion was constructed in plasmid pRIT15115, under the control of the lambda pt promoter. Triple fusion protein (see AAM50662) was produced in E. coli G1724 transformants. This is an example of the production of triple fusion proteins of

                                                                                                                                                                                                                                                                                                                                                             80
the invention comprising ubiquitin fused between thioredoxin and a protein of interest, in this case P501S(aal 320). A claimed method of producing a recombinant protein of interest involves: culturing a host cell (preferably E. coli) under conditions which allow for co-expression of the triple fusion and a ubiquitin-specific endoprotease (especially UBP1 from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the ubiquitin-specific endoprotease in vivo. In the present case, expression was controlled by addition of tryptophan. The recombinant protein can used as a vaccine for cancer therapy.
                                                                                                                                                                                                                                         604 ATGGTCCAGAGGCTGTGGGTGAGCCGCCTGCTGCGGCACCGGAAAGCCCCAGCTCTTGCTG

The invention relates to isolated prostate specific polynecteds, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful, for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nseful for

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (II) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated (II), to the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. It can be used for monitoring the progression of cancer in a patient. (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate value. AMM913157 to AMH93144 and AAM01115 to AMM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encode

polynucleotides, polypetides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer! Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer - \,

The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to exemplification of the present invention.

AAD05220-AAD05282 represent CDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE01413 represent the proteins they encode.

CC AAE01415-AAE01433 represent human secreted protein fragments or variants.

CC AAE014123 represent human secreted protein fragments or variants.

CC AAE014123 represent human secreted protein fragments or variants.

The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

CC parhological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 21 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune of diseases (e.g., rheumatoid archiritis), inflammation, allergies, neurological disorders, schizophrenia, asthma, skin disorders (e.g., nourological disorders, atherosclerosis, cardiovascular disorders, cognitive disorders, fidney disorders, gastrointestinal disorders, proteins can also be used to aid wound healing and epithelial cell corrections in to prevent skin aging due to subbran, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding to process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding cDNA of
                                                                                         New nucleic acid encoding one of 21 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions, such as autoimmune disease and cancer, and used as a food additive or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LeuSerLeuPheLeuIleProArgAlaGlyTrpLeuAlaGlyLeuLeuCysProAspPro 117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ArgProLeuGluLeuAlaLeuLeuIleLeuGlyValGlyLeuLeuAspPheCysGlyGln 137
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      484

polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           óλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated to call the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAMO1115 to AAMO1318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis, and treatment of cancers, particularly prostate cancer. The present sequence is a CDNA described in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated prostate-specific polymerical antibodies raised against the polymeptides for antigenic epitopes antibodies raised against the polymeptides for antigenic epitopes derived from them) and antigen presenting cells expressing the polymeptides. The antigen-presenting cells expressing the prospecially prostate cancer. The polymeptides, polymerications and the antigen-presenting cells are useful for stimulating and/or expanding the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. Compositions comprising the polymerication and for inhibiting an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polymerical for the invention.

                                                                                                                                                                    a
                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                               The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and each be used in vaccine production and gene therapy. (I); (II), and isolated antibodies to (II), inson proteins comprising (II), and isolated [II], and the antibodies are also used in the detection of cancer in a patient. (I) and the antibodies are also used on treated is particularly prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. Analysis7 to Anign3944 and AAM01115 to exemplification of the present invention.

The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to product antibodies which can be used in treatment. The present sequence is one of the PS108 partial coding sequences.

The sequence represents the prostate gene PS108-specific expressed sequence tag (EST) consensus sequence. The sequence was produced from overlapping PS108 ESTs sequences to produce a full length consensus sequence. This sequence was then used to produce PS108 polypeptides which sequence antibodies. The polypeptide is useful for screening compounds which specifically bind to the polypeptide and for screening for drugs, compounds, or any other agent which can be used to treat of diseases associated with PS108. The antibody is useful to detect, or for image localisation of, PS108 antigen in a patient, for detecting or diseases or conditions associated with PS108, especially cancer. The antibody is also cuseful for generating chimeric antibodies for therapeutic useful for generating chimeric antibodies for therapeutic useful for generating chimeric antibodies for therapeutic use, for inhibiting the biological activity of PS108, in therapy (for e.g. to treat prostate tissue disease including prostate cancer and its test metastases), and to detect the presence of any polypeptide in a test and part and the ps108.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            338

The present sequence represents the consensus sequence for a PS108 gene. The sequence is derived from overlapping clones AAV71166-79. The clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatits, prostatic intraeplihalial neoplasia (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       398

The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to produce antibodies which can be used in treatment. The present sequence is one of the PS108 partial coding sequences.

The sequence represents the coding sequence of prostate gene PS108-
specific expressed sequence tag (EST) cDNA clone 1711346IH. The sequence
cas used along with other overlapping cDNA clones to produce a full
clength consensus sequence (see AASO/155). This sequence could then be
length consensus sequence (see AASO/155). This sequence could then be
consecuting antibodies to prostate tissue, and as immunogens to produce
cantibodies. The polypeptide is useful for screening compounds which
specifically bind to the polypeptide and for screening for drugs,
compounds, or any other agent which can be used to treat diseases
cascociated with PS108. The antibody is useful to detecting or diagnosing a
compounds, or any other agent which can be used to treat diseases
cascociated with PS108 antigen in a patient, for detecting or diagnosing a
closalisation of PS108 antigen in a patient, for detecting or diagnosing
condition, as delivery agents for therapeutic agents as well
cas for diagnostic tests and for screening for diseases or conditions
cassociated with PS108, especially cancer. The antibody is also useful for
conditional activity of PS108, in therapeutic use, for inhibiting the
conditional activity of PS108, in therapeutic use, for inhibiting the
clissue disease including prostate cancer and its metastases), and to
detect the presence of any polypeptide in a test sample which shares one
conditionally activity the PS108 polypeptide.
                                                                                                                                                                                  ţ

The present sequence represents the full length contig of the PS108 gene, as represented by clone 171346fH. This clone is the contig of overlapping clones AAV1166-79. The clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, producting, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis,

The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, artibodies raised against the polypeptides for antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the oplynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific protein invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for

                                                       prostate-specific proteins (II). (II) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and the bear of (II), fusion proteins comprising (II), and isolated T cells prepared using (I) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies of (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH03157 to AAH9344 and AAM01115 to AAM01118 represent polynucleotide and amino acid sequences used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is derived from a prostate cancer-associated gene, and is represented by Incyte clone number 1864683. The sequence is used in the method of the invention. The specification describes a method for identifying biomolecules for the diagnosis or treatment of diseases associated with cell proliferation. The method comparises examining polynucleotides, consisting of prostate cancerspecific genes and genes of unknown function, expressed in cDNA libraries. The patterns of both gene sets are compared to identify genes of unknown function with similar expression patterns to the libraries. The patterns of both similar expression patterns to the method form pharmaceutical compositions useful for the diagnosis and treatment of diseases associated with cell proliferation. Such diseases include cancer of the adrenal gland, bladder and bone, but especially prostate cancer. The method may also be applied using other diseases specific genes. The prostate cancer-specific genes facilitate the diagnosis and treatment of cell proliferation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying biomolecules for the diagnosis and treatment of diseases

The invention relates to isolated nucleic acid (ABNB1319-ABNB1324), corresponding to genes differentially expressed in mast cells following activation or in paintents with allergic hypersensitivity disease, (I) that encodes proteins (ABB7756) (II) or a protein fragment of partners. (I) or (II) is useful for diagnosing or treating a disease state (e.g. allergic hypersensitivity, seasonal rhinitis, actima disease state (e.g. allergic hypersensitivity, seasonal rhinitis, actima, urticaria or atopic dermatitis or mastocytosis) in a subject which involves determining the level of expression of (I) or (II). A computer system, comprising a database containing information identifying the expression level in a tissue or at least one mast cell of (I), is useful or presenting information to identify the relative expression level of (I). (II) is used as a marker to detect, diagnose or identify an allergic modulate gene expression or activity and as an antiget that modulate expression of the protein or agents, such as agents that modulate expression of the protein or agents, such as agents that modulate expression of the protein or agents, such as a general antibodies. (II) and thus are useful for a pativity and function of (II) and thus are useful for a pativity and function of (II) and thus are useful for a pativity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seasonal rhinitis, asthma, urticaria, atopic dermatitis or mastocytosis
                                                                                                                                                                                                                                           differentially expressed in mast
                                                                                                                                                                                                                                      Novel isolated nucleic acids that are differentially expressed in mast cells in patients with allergic hypersensitivity, encoding proteins associated with mast cell regranulation and allergic hypersensitivity

of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library. 1751 TGCCTCTTTGGCCTGCTCACCTCATCTTCCTCACCTGCGTAGCAGCCACACTGCTGGTG 1810 1811 GCTGAGGAGGCAGCGCTGGCCCCACCGAGCAGAGAGAGGCTGTCGGCCCCCTCTTG 1870 1631 CGCCAGGCCTACTCTGTCTATGCCTTCATGATCAGTCTTGGGGGGTGCTGGGCTACCTC 1690 The present sequence is a new DNA which encodes an immunogenic portion 237 Polypeptides comprising immunogenic portions of prostate proteins used in a vaccine for the treatment of prostate cancer CysLeuPheGlyLeuLeuThrLeuIlePheLeuThrCysValAlaAlaThrLeuLeuVal AlaGluGluAlaAlaLeuGlyProThrGluProAlaGluGlyLeuSerAlaProSerLeu Prostate; cancer; tumour; vaccine; immunogen; clone; 3' cDNA sequence of prostate tumour clone L1-12 Claim 3; Page 38-39; 130pp; English BP 1871 TCGCCCCACTGCTGTCCATGC 1891 SerProHisCysCysProCys 244 AAV61144 standard; cDNA; 789 98WO-US03492. 98US-0020956. 97US-0806099. 97US-0904804 (first entry) (CORI-) CORIXA CORP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate

The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer -

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1110,
